## **Energy sector**

## Stock picking in the energy sector

## Mixed messages - mixed performances

Energy stocks have generated an unusually great divergence of performance within the sector this year. Neon Energy (NEN) and Beach Energy (BPT) have performed strongly while Carnarvon (CVN) and Dart Energy (DTE) have disappointed.

The industry conditions have also been unusually volatile, with the CSG industry grabbing the headlines for the wrong reasons on a daily basis, and the industry and Government responses have not been helpful for this growth industry. If the next growth story through shale gas and oil is to succeed, the industry will have to lift its game in educating the public, the authorities and politicians.

On the positive side, oil prices have remained quite high, and the outlook for domestic gas prices is looking stronger than ever, largely thanks to the LNG export momentum.

## Stock picks in order of preference

The Energy sector has suffered in line with market weakness and this has created some great investment opportunities. Our recommendations in order of preference are as follows, keeping in mind that the risks in some of these stocks are high.

**NEN** is still our No. 1 pick in the sector. The Californian oil assets are arguably worth more than the current share price and Vietnam exploration offers big upside.

**SEA** is our preferred shale play, with the Bakken production assets worth more than the share price. Upside to other emerging US shale plays comes for free.

**AZZ** is our most undervalued shale play and we are confident that the results will come through to demonstrate value.

**NXS** is a high risk Buy but we think that the pressure to do a deal on Crux will deliver a result better than what the current share price indicates.

**JPR** is likely to be re-rated with the listing on the AIM market imminent. As a Kazakh oil producer it was always going to be hard to get Australian investor support.

**OSH** is trading below our assessed value of the highest quality LNG project being developed in our region. LNG expansion could enhance the value further.

**WPL** is the only current LNG producing company of note and the Pluto project will strengthen this position within 6 months. Low PE's give no credit to growth potential.

**HZN** has 3 key assets. One is in production at Maari, one in development offshore China and one is about to be approved in PNG. Good assets, good growth in oil.

**DTE** faces some near term headwinds as timetables are slipping and CSG "problems" grow. Valuation still supports a Spec Buy but the timing may not be quite right.

**CNX** has significant upside if the UCG concept can be proved. Without Government support, this growth potential may be found overseas which will take more time.

**KAR** is a high risk exploration stock. We consider the Browse basin a tough gig, but we are more positive about the Brazilian drilling to commence in 2Q 2012.

## Stock performances

NEN has been one of the best performing stocks in the Energy sector this year, following a \$26m raising at \$0.25/share in March 2011 (managed by Bell Potter Securities). The company still has cash of \$24m. We strongly believe the best is yet to come for NEN, which is why it's still our No.1 pick in the sector.

SEA was a very strong performer in the 2H of 2010 but has given a lot of that gain back in 2011. We initiated research with a Buy on 3 October 2011, and it has performed positively since then. We believe the company is very likely to regain traction as higher production targets are achieved over the next year, and perhaps success in the Niobrara shale.

At the disappointing end is CNX, where the Queensland Government has made life difficult for all UCG promoters. The Department of Environment and Resource Management (DERM) shut down the CXY project at Kingaroy and has stalled both the CNX and LNC projects near Dalby on several occasions. CNX's Bloodwood Ck UCG project is performing very well but it seems like this revolutionary energy concept may need to be developed overseas.

The middle range performers of our stock coverage have done OK, but neither have they delivered the sort of performance we had expected. The general market conditions have not been conducive for exploration stocks or concept stocks, which is understandable. Bell Potter believes that the market is in the process of bottoming, and there are many energy stocks with fundamentally good valuation support. We think this is an excellent time to be buying energy stocks, for potentially superior returns over the next year.

#### Investment view

We continue to recommend NEN as a Spec Buy. We believe the current share price only reflects the base case Californian oil projects. The Vietnam exploration prospects are world class and offer very large upside. Our risked valuation is \$1.00/share and the unrisked value could be in excess of \$6.00.

- The North San Ardo oil field generates enough cash flow to cover all of the company's overheads.
- The Paloma Deep well currently drilling has found oil in a secondary target (3-4mmbbl potential) on the way down to the primary targets (1-20mmbbl potential).
- The Paris Valley oil project has over 100mmbbl of oil in place, but it's heavy and viscous. Can horizontal steam flooding generate a commercial return?
- A farm-out of the Vietnamese exploration licenses would lead to drilling these big targets in the 1H 2012 with a credible partner.

## ExxonMobil encounters hydrocarbons in offshore Vietnam

XOM has confirmed that they have made a discovery offshore Vietnam which the media has suggested could have potential reserves in the 4-7Tcf range. It is fair to say that XOM would not make a comment unless it could be a materially important project. This part of the Song Hong basin is very lightly explored and a new discovery of this size would increase the prospectivity in a major way. This is very positive for NEN, which holds 50% of Block 120 immediately to the south of Exxon's Blocks 117-118-119 but also 50% of Block 105 to the north. As NEN is currently discussing a farm-out of its 2012 drilling program in Vietnam, the XOM news can only be helpful in clinching a good deal, which we expect to be announced in November 2011.

## Paloma Deep main targets about to be drilled

NEN has announced that logs have shown the Paloma sandstone to have 205 feet of oil saturation. The best part of the reservoir is in the upper 55 feet, with 39 feet net reservoir. We understand pressure data is good, reducing the risk that historical production on the greater Paloma structure has impacted reserves at this location. Using average reservoir parameters over a stated 450 acre play, we estimate this could be 3-4mmbbl recoverable, of which NEN owns 75%. This would be worth \$0.06-0.07/share. The remaining oil column in the Paloma sandstone is of lower reservoir quality and may not flow at commercial rates in its own right, but could add 1-2mmbbl reserves over time.

The primary targets in Paloma Deep are in the Middle and Lower Stevens sandstones. Each target is about double the reserves potential of the Paloma sandstone now sitting behind casing. It's always encouraging to find oil on the way down to a primary target, and we look forward to further drilling updates over the next 2-3 weeks, with testing likely to follow. The well has set intermediate casing and is drilling ahead below 11,000 feet and has a planned depth of 13,500 feet.

#### Investment view

The stock appeals to us as an established oil producer in the Bakken, one of the two premier shale regions of the US (the other being the Eagleford shale). The company has also positioned itself in other new US shale plays such as the Niobrara and the Mississippian for longer term growth options. Our risked valuation is \$0.86/share, including \$0.64 attributable to the proven Bakken assets. The stock is a Buy with the following key investment attributes:

- Quality asset in the US Bakken shale oil play
- Upside potential from new shale plays in the Niobrara and the Mississippian
- Undrawn US\$100m debt facility from the Bank of Oklahoma
- Producing 1,000bopd now, targeting 5,000bopd in 2-4 years
- A nicely diversified US shale play

### Proven Bakken oil producer, upside from Niobrara shale

SEA is a US shale oil production company with current production of about 1,00boepd sourced from the Bakken shales in North Dakota. The company has an ambition to reach 5,000boepd in the next 2-4 years based on its 8,667 acres in the Bakken and the 15,000 acres it owns in the Niobrara shale play of Wyoming and Colorado. It's not hard to see the company achieving its objectives, which should double or triple the market cap.

### Strong valuation support

We value SEA's Bakken oil shale assets alone at \$0.64/share and this could be conservative as we use a low Estimated Ultimate Reserve (EUR) of 0.7mmboe per 10,000ft lateral well compared to the surrounding area's average of >0.8mmboe. The company's Niobrara shale properties look promising but have been risked to reflect the immaturity of this new oil shale region. Overall 3P reserves are certified at 26mmboe (77% attributable to the Bakken) but could be substantially higher. Our risked valuation for SEA is \$0.86/share and an unrisked value is \$0.93/share which still could be conservative. The company generated revenue of \$18m in FY11 and has \$24m in cash plus an undrawn US\$100m debt facility provided by the Bank of Oklahoma.

#### **Investment View**

Among the Australian companies seeking to build a shale business in the US, AZZ stands out as one of the most undervalued. On our risked valuation of \$1.00/share, the stock should be trading at least double the current share price and it could triple over the next year or two.

- Focus on the Permian basin, Texas, one of the "hot" shale plays in the US
- Fully funded for the next three years
- Very cheap if management get it right
- EV per 2P reserves barrel is a low \$3.80
- PE of 7.8x in FY12, 4.5x in FY13

Obviously the market remains sceptical about the company's growth plans or the share price would be higher. While this has been disappointing, the management is getting on with the job of drilling and completing wells and early results from the first handful of wells are encouraging. The company has drilled a dozen wells since acquiring the properties earlier this year and as further results come through, we expect market recognition to grow.

#### Permian focused

AZZ operates in the low cost Permian basin of West Texas where an unusually thick sequence of oil rich shales and conventional reservoirs are stacked on top of each other. The Permian is one of the hottest shale plays in the US at the moment with over 180 drilling rigs active there, and a range of companies stepping up their involvement. For example Petrohawk, the company recently acquired by BHP for \$15B holds about one-third of its total acres in the Permian basin.

The Permian has historically been the largest oil producing region of Texas and current production is 900,000boepd. AZZ has picked up three promising projects with combined potential greater than 100mmboe of reserves. The company is planning to grow its oil production from the current level of 700boepd to 2,000boepd next year and 3,000boepd in 2013. This growth profile is less risky than usually forecast from conventional oil & gas stocks due to the predictability and repeatability of shale plays.

## Funding in place

AZZ has secured a US\$200m debt facility with Macquarie Bank for its growth projects in the Permian basin in Texas, and is now funded for the next three years, and probably to the stage where growth becomes self funding.

The fact that a major bank is willing to support the company's development drilling is also a vote of confidence in the asset. We value the company's key asset at the Southern Star shale oil project at \$239m or \$0.91/share out of the total stock valuation of \$1.00/share.

#### **Absolute Price**

#### **Investment View**

The key issue facing NXS shareholders is the Board structure which will be voted upon at the AGM on November 17. Former CEO Richard Cottee who stepped down on 22 September 2011 is seeking support from institutional and retail investors to be reappointed. The outcome is difficult to predict but it will have an important bearing on the future of NXS. The future for the company is unusually difficult to predict and stock is therefore very high risk, which is reflected in our Spec Buy recommendation.

Board stability cannot be guaranteed and the ability to execute a deal on Crux remains uncertain. Our attraction to NXS has always been the +70mmbbl of liquids in Crux. However, the financial constraints and commercial complexities have frustrated the monetization of this asset so far. A deal would unlock value and take the stock towards our price target of \$0.39. However the clock is ticking ...

## Crux decision going to the wire

The key asset in NXS' portfolio is the liquids rich gas discovery at Crux in the Browse basin. The company continues to state that it can bring in a partner and a \$1bn debt funding package in order to take FID before the end of this year. A deal to move forward would enable NXS to exercise the option with Shell to extend the liquids production period until 2024. This timetable is obviously tight and the key risk in NXS.

#### Valuation scenarios

NXS is difficult to value as the Crux project value will depend on a number of possible outcomes to this development, in which they currently own 85% of the liquids.

- Our base case valuation of \$0.39/share assumes that NXS retains a 20% interest in the development and that an incoming partner funds the company's share of capex, with first production in 2014.
- The company is actually hoping to sell 35% for cash and that this will enable the company to retain a 50% stake and operatorship of the project. This would on our numbers lead to a valuation of \$0.63/share.
- Another option is that Shell takes over operatorship of Crux, which would probably lead to lengthy delays until first production, possibly until the next decade. Our valuation of NXS would be about \$0.30/share on that basis.

The outlook for NXS is clearly very uncertain. Hopefully the market will get better clarity of the Crux project development and Board and management structure in the short term. NXS only suits investors with a high tolerance to risk.

## Absolute Price

SOURCE: IRESS

#### **Investment View**

We maintain a Spec Buy on JPR as it trades on a massive discount to its valuation of \$2.42/share. JPR must be one of the cheapest stock on the ASX for certified 2P reserves of 24.2mmbbl at around \$2.50/bbl. Our DCF valuation of the 2P reserves is \$9.65/bbl and represents \$1.96/share. The resource potential of an estimated 85mmbbl does not appear high risk, but requires drilling. We understand there is a perception of political risk in Kazakhstan but the discount is excessive in our view.

- Undervalued Kazakh oil reserves
- AIM listing 9<sup>th</sup> November should help re-rating of stock
- Production licenses for first two oil wells are imminent
- Flow rates from 3<sup>rd</sup> oil well are also due soon
- Kazakhstan discount is too big!

## AIM listing could lift share price

JPR will be listing on the AIM market on the 9 November 2011. We believe the AIM is a better market than the ASX for a company active in Kazakhstan as Australian investors are typically risk averse to countries that they are not familiar with. Furthermore, an AIM listing could be a share price catalyst for the stock. It will be interesting to see how the volume of trading migrates to AIM in coming months.

We expect a strengthening share price, although this may be held back somewhat due to the need for the company to raise further equity capital.

## Two Trial Production Licenses approved

JPR has announced that Trial Production Licenses (TPL) have been approved by the Kazakh Central Development Committee for wells J-50 and J-52. While production won't start immediately as other steps are required, this is very good news for JPR shareholders. The ability to commence oil production and exports of about 900bopd will signal the commencement of first cash flows for the company before year end. Subsequent TPLs should also be approved much quicker following the drilling and testing of upcoming wells. TPLs are for individual wells and valid for three years, ahead of a full field Production License.

#### Test results of oil flows from J-51 soon

We expect that JPR will soon release some of the initial flow rates from the J-51 well in Block 31. The well should flow strongly, as it had a net/gross oil column 20% greater than the previous two wells on this oil field. We would not be surprised if the well flows a stabilised rate over 1,000bopd on a 12mm choke, and perhaps 600-700bopd on a 8mm choke. Our current modelling assumes initial production rates of 450bopd per well. If the authorities allow JPR to produce the field at higher rates, it will be very positive for the valuation.

**Energy** 

#### **Absolute Price**

SOURCE: IRESS

#### **Investment View**

OSH is a standout in the Australian energy sector with PNG LNG becoming a game changer for the company. The robust economics of PNG LNG means it can withstand an increase in cost and still remain competitive. We believe the announcement of an expansion train is on the horizon with drilling commencing shortly in a country which remains underexplored. The current share price presents a free option on T3 and catalysts over the next 6 to 12 months should also provide further upside to the share price. Buy recommendation with a Target Price of \$7.49/share and key reasons for this view can be summarised as follows:

- PNG LNG is a very high quality project
- The project is transformational for OSH and PNG
- Production will lift 4 fold
- Excellent expansion opportunities, could lead to a share price of c.\$10.00

Risks include cost blow-outs, delays, landowner disputes or political changes, but we have allowed for the first two risks. The other two risks tend to generate short term noise, but have limited impact on operations.

#### A Standout in the crowd

The prospects for OSH are promising with medium term earnings highly leveraged to the oil price and the company set to enter transformational growth from 2014. Not only will production increase by four fold when PNG LNG delivers first gas, the robust economics of the ExxonMobil-led project also far outweigh any of its Australian peers. The global LNG market is looking increasingly uncertain and only economically robust projects can compete in unfavourable environments. We believe OSH, through PNG LNG will be able to reap maximum profits in a sellers' market but also remain competitive in less favourable environments.

### PNG LNG – a project that can weather the storms

A project IRR of 20% is outstanding compared to its Australian peers with IRR's in the low to mid 10's. The investment case for an expansion train is even more compelling with the 3rd train realising an IRR up to 34% if feedgas can be sourced from nearby fields. PNG LNG comes from an onshore conventional source which eliminates the risk of capital intensive offshore developments and avoids the increasing challenges that unconventional CSG projects are facing. Its value is further enhanced by the high liquids content and lucrative sales agreements. Furthermore, if the first two trains (T1 & T2) can be delivered on time and on budget, we estimate their cash flows have the capacity to fund the development of T3. As such, a capital raising may not be required.

## Absolute Price

## **Investment View**

WPL is the only major LNG producer in Australia for the next three years, with a near term step-change through the Pluto foundation project due to start in less than six months. The market is not factoring in any Pluto expansion(s) or the upside potential at Browse LNG or Sunrise LNG, and perhaps rightly so. Past management disappointed on the Pluto project delivery and it's up to the new MD Peter Coleman to manage the market expectations better.

We believe fundamental value exists in WPL's growth projects but significant progress is required on all fronts. The likely sell-down of Shell's remaining 24% stake in WPL is acting as an overhang and the removal of this could provide some support to the share price. Given the recent recovery in the share price, we have reduced our recommendation to Accumulate from Buy with a new Price Target of \$40.10/share due to mark-to-market on oil prices and currency.

#### All eyes on Pluto

WPL's recent quarterly stated commissioning at Pluto is progressing to plan. First LNG cargo is still estimated for March 2012, and although there is some nervousness in the market on this timeline, we don't believe WPL would make such a statement if it was at risk. The expansion plans at Pluto continue, with six wells to be drilled between now and mid-2012 while third party supply options with parties such as BHP and Hess continue. A deal with BHP (and ExxonMobil) on Scarborough gas supply could suddenly provide clarity and certainty over a multiple LNG Train expansion at Pluto. Such an outcome would propel the share price much higher.

#### Browse basin is still in the mix

WPL owns about 47% of the 13Tcf + 360mmbbl Browse gas project. The JV is not exactly aligned, but the last renewal of the license stipulated that they spend \$1.25B on feasibility studies to demonstrate whether it's commercial or not by mid 2012. As a \$25 or \$30B capex project to produce 12mtpa of LNG, it is a serious project that could be a positive for the WPL share price in 2012, as there is little recognition for it in the current share price.

### Even Sunrise could get a new chance

WPL's new MD Peter Coleman has reportedly had a productive meeting with the East Timor Government on the development options on the Sunrise gas project in the Timor Sea. This is a smaller 5 Tcf gas field with liquids of 240mmbbl ideally suited for FLNG. However, the East Timor Government has so far insisted on a pipeline to East Timor for an onshore based LNG project. WPL owns 34% of the project and we put a low likelihood of this project going ahead soon due to the political machinations. Any change to this stalemate would be a positive for WPL.

**Energy** 

## Absolute Price

## A good package in our view but a poor market rating

HZN has been one of our recommended mid cap oil stocks for some time, particularly for investors with a lower risk tolerance, in a sector that tends to be high risk and volatile. This has not stopped HZN's share price from disappointing this year.

We continue to regard the stock undervalued and we reiterate a Buy recommendation, with a valuation of \$0.51/share.

## Maari oil production has disappointed

The company's current production asset is at the Maari oil project in New Zealand, which has underperformed but appears to have found a base around 15,000bopd.

The project has been plagued by downhole pump failures and reduced productivity as a phenomenon called scaling inhibits flow rates. The operator OMV is working hard to improve reliability and if all the wells can be run without interruption then field production is likely to exceed 20,000bopd. This is not in our forecasts and we predict a further gradual decline in production.

#### **Beibu Gulf**

Unlike most oil & gas stocks, the upside in HZN is not so much about exploration success, but execution of new developments. CNOOC is the operator for Beibu Gulf, where it has a proven track record of developing oil projects. FID was taken early this year and a significant proportion of the US\$300m capex has been locked in on fixed contracts. The project is planned to commence late 2012 but we have delayed our assumed start-up until 1H 2013.

## PNG gas and liquids

The Stanley liquids stripping project represents HZN's first operatorship at the development level. Its PNG partner is Canada's Talisman Energy, which is looking to commercialise several gas discoveries found in Western PNG, including Stanley, Elevala and Ketu. HZN and Talisman are expected to take FID on the Stanley liquids project before the end of this year, and plans to drill Elevala-2 and Ketu-2 over the coming months. Any success at these two liquids rich gas discoveries could lead to a significant expansion of the Stanley liquids project. It could also lead to a gas for power generation project but we do not value this upside in HZN at this stage.

## Market rating

The reason HZN has performed relatively poorly this year appears to stem from the convertible note issue in June 2011. Some investors don't like mid caps taking on debt or indeed convertible notes. We regard the notes as debt, and we like the fact that they were issued with a conversion price about 39% above the then share price. We think it it is better to effectively issue equity at a premium rather than at a discount, which is dilutive to shareholders. Management of HZN needed to explain this better to the market.

SOURCE: IRESS

#### **Investment View**

With a valuation of \$1.03/share, we believe DTE is undervalued. However, we see some downside risk in the near term. Not only has the Australian CBM sector been weighed down by the increasingly vocal community over environmental concerns, the company's targets for 2011 are likely to slip. While we continue to like DTE for its diversified portfolio with exposure to high gas demand markets, management needs to act quickly or risk the share price languish further. The introduction of strategic partners and/or a successful separate listing of DTE elsewhere may provide greater see-through value and we anticipate the outcome of this by March 2012.

## Dajing disappoints so far

The much anticipated exploration drilling at Dajing is finally underway (slipped from 2Q 11) with ten of the 14 wells now complete evaluating 50% of the ultimate block potential by area. However, initial well results are below the pre-drill estimates as a result of lower gas content found in the coal. DTE plans to drill the last four wells in early 2012 followed by an assessment of the prospective resource. It may be too early to conclude but if Dajing proves to be uneconomical for development, the significant size of the license means it would have a material impact on the valuation. Dajing makes up 25% or \$0.25/sh of our valuation of DTE.

## Targets for 2011 could slip

Management's targets for 2011 released in April 2011 at the time of a \$100m equity raising were encouraging. However, many of these are likely to slip and are unlikely to materialise until at least mid-2012.

### Not easy to get funding

Unlike conventional projects, CBM requires a large amount of wells to be drilled throughout the life of the project and particularly during the ramp-up phase. As such adequate funding is one of the hurdles small companies like DTE needs to overcome. With a Gas Sales Agreement to fulfil in Scotland, we expect a shortfall of c.\$60m by mid 2012 which the company plans to fund via project financing. While this makes sense for the company, we believe project finance is not readily available for CBM projects. We believe farm-outs and/or an equity raising are more likely.

#### **Absolute Price**

#### **Investment View**

We believe CNX has significant upside potential if the UCG concept is commercially proved. The technical proof of concept has arguably been demonstrated, but the market appears to be waiting for the commencement of electricity sales from Bloodwood Creek and the go-ahead at another UCG project such as Mulpun in Chile where power prices are higher. The introduction of an Australian carbon tax will make UCG more competitive than coal fired power generation. However, ultimately we see the biggest potential for UCG overseas. The connection of Bloodwood Creek to the grid is the next share price catalyst for CNX.

Spec Buy with a risked valuation of \$0.63/share and an unrisked valuation of \$1.94/share.

## Connection to the grid looks on track

CNX is using Underground Coal Gasification (UCG) technology developed by the CSIRO to convert in situ coal to synthetic gas (syngas) for power generation and ammonia production. The company's UCG trial at Bloodwood Creek near Dalby in Queensland is awaiting Ergon Energy to complete work at the substation before connection to the power grid. The timetable for this is out of CNX's control but should be completed this November.

It is also worth noting that DERM approvals to generate the full 5MW capacity are yet to be achieved, with current approvals only up to 1MW. The company hopes this is forthcoming but DERM has been slow on past occasions.

## Chile project next, other overseas opportunities await

CNX has a 30% share of a UCG project in Chile, in partnership with Antofagasta, a major copper miner and diversified conglomerate. The partners are preparing for a UCG pilot project at Mulpun, with high hopes to build a 300MW plant if the results are encouraging. This would be a very attractive project based on our preliminary modelling as power prices in Chile are very high.

CNX has other projects overseas, such as US, Turkey and India but all of these are behind the developments in Queensland and Chile.

### Fund raising out of the way

With a monthly cash burn of \$1.5-2.0m the company's need for cash will lead to regular equity raisings as cash flow is low and debt financing is not available for a concept. On 6 October, CNX announced a \$10m raising through the placement of a convertible loan facility to its major shareholder Pacific Road Capital and \$10m through a 1-for-8 non-renounceable rights issue at \$0.12/share. The rights issue price was at a 17% discount to the closing price and is not underwritten.

## Important drilling campaigns ahead

KAR is preparing for a 5-8 well drilling program in the Browse basin to follow up the Poseidon/Kronos gas discoveries, and to start its Brazilian exploration in the 1H 2012. We are more attracted to the South American potential than the Browse acreage, where remoteness, target depths and uncertain reservoirs/gas qualities suggest a challenging commercial path, as demonstrated by many similar projects such as WPL's Browse LNG, Inpex's Ichthys, NXS' Crux and Shell's Prelude projects. We maintain a Spec Buy with a \$11.00/share risked target but investors must recognise that this is high risk exploration.

- Browse exploration remains a tough gig
- Brazil and Peru appear to offer better risk/reward in our view
- Funding OK for the next 18 months

## Browse drilling campaign to re-commence

KAR has contracted the TransOcean Legend to drill 5-8 appraisal and exploration wells starting before the end of this year. The program is expected to take 18-24 months and cost KAR about \$180m.

We downgraded our expectations at Poseidon last year to a 35% chance of success, and recent drilling by WPL at Argus-2 has not made us more positively inclined. The Argus discovery is located 60km to the north of Poseidon and was unable to reach the very deep reservoirs at 5km depth due to high pressures. This is a similar problem encountered at Poseidon-1 and 2, where KAR managed to get to the reservoir but was unable to conduct testing due to high pressures. While it's possible that these challenges can be overcome, we also observe that companies like WPL and Inpex have discovered 13Tcf of gas each with higher liquids content hosted in better reservoirs and have still not been able to commit to developments. The Browse is undoubtedly a very tough gig and the odds for success are long.

## Partner sought for Brazilian drilling plans in 2Q 2012

KAR has also contracted a drilling rig for a three well program offshore Brazil in 2Q 2012. The company currently owns 100% of these blocks but are seeking farm-in partners to fund the bulk of the costs, which could amount to \$100m.

These oil prospects are wildcats, but appear quite attractive as nearby discoveries and high quality 3D seismic reduce the risks somewhat. KAR's independent consultants DeGolyer MacNaughton have assessed the risks in the 20-50% range for reserves potential in the 100-500mmbbl range. That's pretty good, and we are attracted to this drilling program, as well as a possible later exploration program offshore Peru for later in 2012.

#### **Recommendation structure**

Spec Buy: Expect >30% total return on a 12 month view but carries significantly higher risk than its sector

Buy: Expect >15% total return on a 12 month view

Accumulate: Expect total return between 5% and 15% on a 12 month

**Hold:** Expect total return between -5%

Reduce: Expect total return between -

Sell: Expect <-15% total return on a 12 month view
